Internship Title: Disease Prediction using Django and Machine Learning

WEEKLY REPORT-1

Completed Tasks:

- Attended the orientation session and discussed the internship project scope: a Django-based web application for predicting diseases from patient-reported symptoms using machine learning.
- Installed and configured the development environment: Python, pip, virtual environment, and Django framework.
- Studied the Kaggle "Disease Prediction Using Machine Learning" dataset to understand the symptom and disease columns.
- Set up the base Django project (disease_prediction) and created the initial apps: main_app, accounts, and chats.
- Configured the project's URL routing structure and connected the SQLite database for local development.
- Reviewed Django's MVT (Model-View-Template) architecture and authentication system (django.contrib.auth) to plan the patient/doctor/admin role structure.

Plans for next week:

- Design and implement the database models for patient, doctor, and disease information records.
- Set up Django's built-in admin panel for managing users and records.
- Begin building the signup and login views for patients and doctors.
- Start exploring scikit-learn basics for the upcoming model training phase.
