Student ID: 24DCE106

Internship Title: Disease Prediction using Django and Machine Learning

# WEEKLY REPORT-2

## Completed Tasks:

- Designed and implemented Django models: patient, doctor, diseaseinfo, consultation, and rating_review, including OneToOneField links to Django's User model.
- Implemented the signup and sign-in views for both patients and doctors (accounts app), including password confirmation and duplicate username/email checks.
- Built the patient and doctor profile pages (profile.html, view_profile.html) along with corresponding URL patterns.
- Registered all core models with the Django admin site for quick data inspection during development.
- Began preprocessing the symptom dataset identifying the full list of 132 symptoms and 41 disease labels used for training.
- Ran initial experiments training a Naive Bayes classifier (MultinomialNB) on the encoded symptom-disease dataset.

## Plans for next week:

- Finalize the trained model and export it using joblib for integration into the Django app.
- Build the symptom-selection form (checkdisease page) with a searchable dropdown for symptoms.
- Wire up the AJAX call from the frontend to a Django view that loads the model and returns predictions.
- Begin designing the doctor-specialization mapping logic for routing predicted diseases to relevant specialists.

## References:

- scikit-learn documentation - Naive Bayes classifiers (MultinomialNB).
- joblib documentation for model serialization.
- Django Forms and ModelForm documentation.
