Internship Title: Disease Prediction using Django and Machine Learning

WEEKLY REPORT-3

Completed Tasks:

- Completed the checkdisease view: built the 132-length binary symptom vector from user-selected symptoms and passed it to the trained model for prediction.
- Integrated model.predict() and model.predict_proba() to return both the predicted disease and a confidence score to the frontend via JsonResponse.
- Implemented the rule-based disease-to-specialist mapping (e.g. Cardiologist, Dermatologist, Gastroenterologist) so patients are routed to the right type of doctor after a prediction.
- Saved each prediction to the diseaseinfo model, linked to the logged-in patient, for later reference in consultation history.
- Built the consult-a-doctor flow: listing available doctors, creating a consultation record, and linking it to the relevant diseaseinfo entry.
- Started the in-app chat feature (chats app) for patient-doctor consultations, including the Chat model and AJAX-based message posting.

Plans for next week:

- Complete the consultation history views for both patients and doctors.
- Add the doctor rating and review system after a consultation is closed.
- Begin styling all templates consistently using Bootstrap and test the complete user journey end-to-end.
- Start writing test cases and fixing edge cases found during manual testing.

References:

- Django JsonResponse and AJAX integration patterns.
- Bootstrap 4 documentation for frontend styling.
- Project dataset and trained model files (trained_model, symptom/disease lists).
